INTRODUCTION

The factors responsible for the rise in water consumption

High standards of living

-High population growth rate

-Increasing urbanization and industrialization

-Failure to adopt basic water conservation principles

-Insufficient energy for seawater desalination

-Regional conflicts resulting in mass flow of internal migrants

-Lack of public awareness

INTRODUCTION

Water Problems in Egypt

**Contamination
of water**

**Mixing with sewage or
agricultural or
industrial wastes.**

**The stability of water
resources and high
population growth rates**

**Decline in per capita
share of water in
Egypt to 600 cubic
meters per year.**

Nile River (Main source)

**Different forms
of Human
consumption**

Industry

Agriculture

**Problems with
upstream
countries**

- **Most problem solutions can be carried out by:**

- **Waste Water treatment**
- **Desalination**

In The Research Field

- **Application in Lab Scale.**
- **Application of Research Projects on the ground By applying these projects on pilot units to reach the optimum ways to implement these projects.**

NRC and Flat sheet membrane group

Accordingly,

- *The flat sheet membranes group has been configured in NRC at 2014.*
- *The header of this group is Prof. Dr. Ahmed Shaban Vice President of the NRC Centre for Technical Affairs.*
- *National Research Center was purchased Spiral wound fabrication machines to facilitate production of pilot samples of spiral wound membranes modules and facilitate the Pilot experiments in desalination and water treatment*

Goals of Flat membranes group in National Research Centre

- Benefiting from our previous experience and researches in Membrane Fabrication, Nanomaterials, water treatment and Desalination to Design low power cost desalination and water treatment units.**
- Production of different kinds of membranes (MF, UF, NF, FO and RO) in large scale and in the form of spiral wound membrane modules to be applied in different applications.**
- Production of antifouling Membranes using different kinds of nanomaterials.**
- Designing of Low power desalination systems, To serve the coastal and remote areas**

Previous work of group in Membrane field

Egyptian Patent 2003 (for water treatment)
(Manufacture of Polyamide-6 using casting technique) for protein removal

Polymeric blend membranes (for Desalination)

Egyptian Patent 2015

(Fabrication of RO blend PES/CA membranes)

Desalinate brackish Water 6000 ppm

Salt rejection 99%, Permeate flux 21 L/m².h

Low RO pressure membrane (15-20 bar)

Previous work of group in Membrane field

For Water treatment

Egyptian Patent 2015

Design and development of Polyamide-6 (PA-6) membranes for pervaporation of water /alcohols mixtures.

Nano materials blend membranes

Polymer blend with Inorganic Nanotubes to produce high flux RO membranes, with low pressure

Used to desalinate a wide range of salty concentrated solutions in range of (3000 ppm to 45000 ppm) SR (99-95%) with low pressure (15-30 bar)

TEM analysis for TiO₂ dioxide nanotubes

Nano materials blend membranes

*Polymer blend with Metalorganic Nanomaterials
To produce RO PES membranes*

**Used to desalinate sea water from 45000 ppm to 4500 ppm. The achieved flux was 24.2 L/m²h with salt rejection 99.9%, with low pressure (20-30 bar)
Decrease in RS (2.4µm PES to 0.24µm)**

SEM of metalorganic nanomaterials

Forward osmosis membrane

For low energy desalination system

Recently, 2017

Fabrication of Spiral wound membranes

Fabrication of Spiral wound membranes

Materials and Methods

Different polymeric materials were used in membrane preparation, we selected new RO type which was blended PES with amine nano- solution to produce RO flat sheet without outside coating.

We submitted a patent in this polymer membrane preparation for Egyptian Academy of Science & Technology in title:

Fabrication of Antifouling Spiral Wound Reverse Osmosis Membranes supported by fabric (Patent No.1301/2016).

We also, fabricated pilot scale casting machine using raw materials purchased from Egyptian local market and we progress to other patent in title:

Design and manufacture of a device for the preparation of flat membranes (Patent No. 0167/2015).

We also, designed and fabricated testing desalination unit using high pressure up to 200 bar. And we progress to other patent in title:

Design, manufacture and test the unit cells of polymeric membranes (Patent No. 1852/2015)

Fabrication of Asymmetric RO Blend Membranes

Polymeric solution preparation was casted using pilot casting machine

Fabrication of Asymmetric RO Blend Membranes

Units for membrane surface treatment and storing

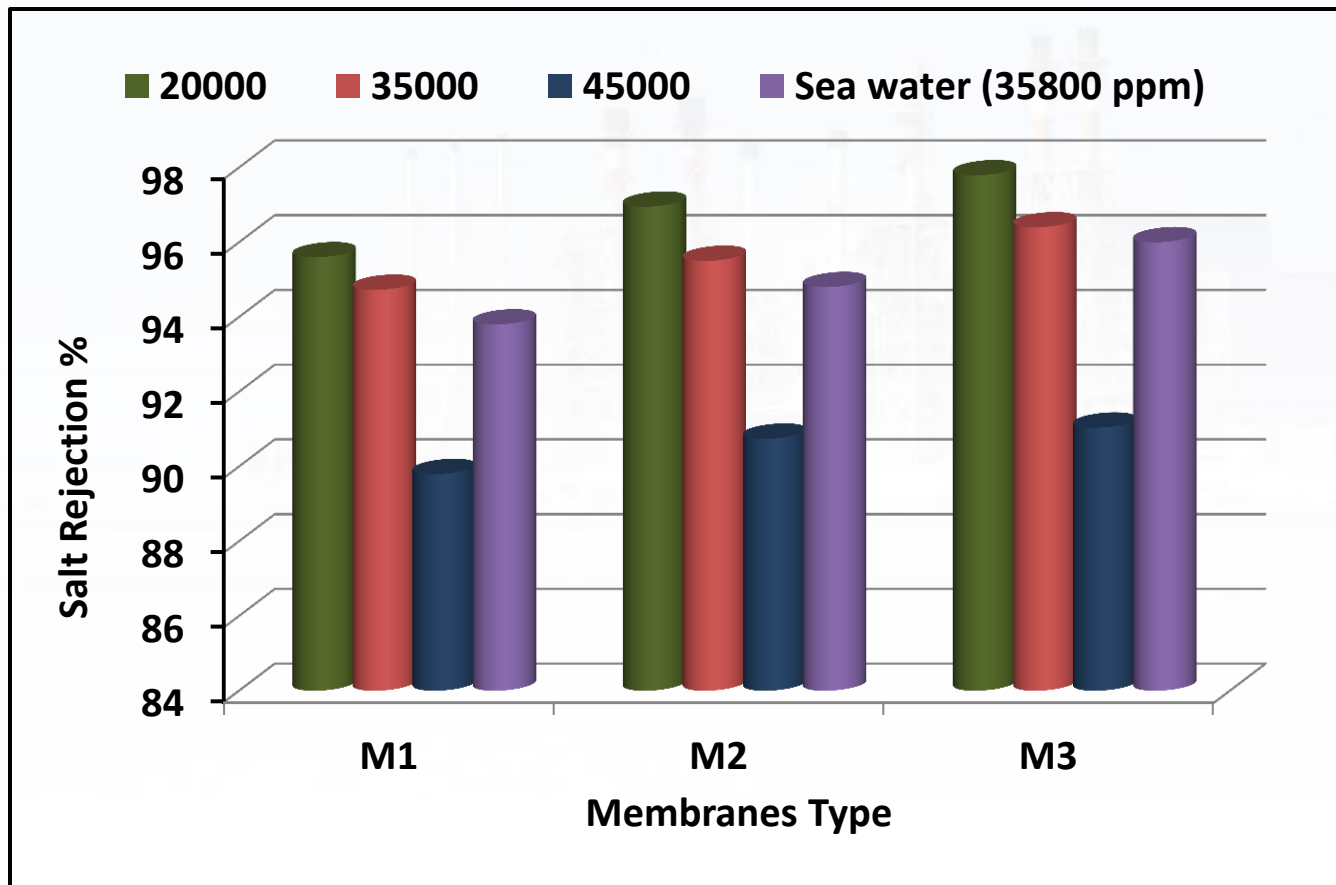

Flat sheet membrane testing

Flat sheet membranes exposed To gradually different high pressures from 15 to 100 bar.

Desalination Results of RO membranes

M1: PES /AMS

without support

M2: PES /AMS

with nonwoven
support

M3: PES /AMS

with woven
support

Under 50 bar
pressure

Desalination Results of RO membranes

Flat Sheet Membrane Housing

- *Low surface area and need large space
- *low Permeate flux
- *low rejection %

- *High surface area according to number of membranes
- *Small in Size and don't need large space
- *High Permeate flux
- *High rejection %

Spiral wound membrane and Housing

Flat Housing of Flat sheet membrane

What is spiral wound membrane

It is layers of flat-sheet membranes and feed separators wrapped around a hollow core. Feed solutions enter one end of the element, flowing under pressure through the membrane into permeate channels, spiral to the central core, and exit as permeate. This configuration offers the highest membrane-packing area with the smallest footprint.

Fabrication of Spiral Wound Membrane

Low Power Desalination Pilot Units

UF/RO integrated Pilot system

RO spiral wound modules (4021)
(two modules)

Spiral wound membrane with
local materials SR 99%
Permeate flux 390.3 L/m².h

The Cost of Membranes

The total cost of flat sheet membrane cost using fabricated casting machine is the 1125.4 L.E. /m².

The price of commercial flat sheet membrane is around 300 \$/m² [*]. Approx . 6000 L.E/m² flat sheet .

RO Membrane module	Imported modules [**] (\$) without taxes and customs	Imported modules (L.E) without taxes and customs	Approx. price of produced spiral wound modules in NRC labs; Egypt
4"x40" for sea water desalination	1090 \$	21,800 L.E	7,500 to 10,500 L.E
8"x 40" for Sea water desalination	1778 \$	35,560 L.E	15,750 to 20,750 L.E
